Puffing Tobacco With Gaseous Oxides - P.M. #568

Suggested information and changes are complete for P.M. Disclosure #568. The correct spelling for the flask is "Dewar." I do not have the weight of the puffing agent in these examples although the tobacco weight is about 20-25 grams.

The control in the examples was untreated as compared to the sample. The moisture was 12% O.V. in the control and it was not heated or sent through the tower (tobacco less solvent through the tower at 600°F burns very badly). I have no available information on immediate sources of SO₂ and N₂O except on a commercial basis.

If any further information is needed, please contact me.
